

Experiment No. 2

Title:

Use var, let, const, and demonstrate basic features like template literals and destructuring; build a billing calculator with user input.

Software / Tools Required:

1. Visual Studio Code (VS Code)
2. Google Chrome
3. HTML5
4. JavaScript (ES6)

Theory

JavaScript ES6 introduced several modern features that make programming easier and more efficient.

(a) var

1. Function-scoped variable.
2. Can be redeclared and updated.

(b) let

1. Block-scoped variable.
2. Can be updated but cannot be redeclared in the same scope.

(c) const

1. Block-scoped variable.
2. Cannot be reassigned after initialization.

(d) Template Literals

Template literals allow embedding variables directly inside strings using **backticks** (```) and **`$${}`**.

(e) Destructuring

Destructuring extracts values from arrays or objects into separate variables.

Shopping App – Billing Calculator

Accepts User Input Such As:

1. Customer Name
2. Product Name
3. Quantity
4. Price

It Calculates:

1. Total Price
2. Final Amount
3. GST

Result / Conclusion

The practical was completed successfully. The concepts of **var**, **let**, **const**, **template literals**, **and destructuring** were implemented. A billing calculator was developed that accepts user input, performs calculations, and displays the final bill accurately using JavaScript.
