

Experiment No. 8

Title:

Demonstration of Form Field Access and Event Handling; Development of a Gym Admission Form with Live Input Validation using JavaScript.

Software / Tools Required:

1. Visual Studio Code (VS Code)
2. Google Chrome
3. HTML5
4. CSS3
5. JavaScript (ES6)

Theory:

Form handling in JavaScript allows a webpage to access and process information entered by the user. JavaScript can access form fields using methods such as `getElementById()` and can retrieve or modify their values using the `.value` property.

(a) Form Field Access

JavaScript can access HTML form elements and retrieve the data entered by the user. The `.value` property is used to get the current value of an input field.

(b) Event Handling

Events are actions performed by the user, such as typing, clicking, focusing on a field, or submitting a form. JavaScript event handlers are used to respond to these actions.

Common events include:

1. `input` – occurs when the value of an input field changes.
2. `focus` – occurs when an input field receives focus.
3. `blur` – occurs when an input field loses focus.
4. `change` – occurs when the value of a field is changed.
5. `submit` – occurs when the form is submitted.

(c) Live Input Validation

Live validation checks the user's input while the form is being filled. It helps identify invalid or incomplete information immediately and provides suitable feedback to the user.

Gym Admission Form

Accepts User Input Such As:

1. Full Name
2. Age
3. Email
4. Mobile Number
5. Membership Plan

It Performs:

1. Accesses form fields using JavaScript.
2. Checks the entered information using events.
3. Validates the input while the user enters the details.
4. Displays appropriate validation messages.
5. Processes the form when valid information is submitted.
6. Displays a **"Gym Admission Successful!"** message after successful submission.

Result / Conclusion:

The practical was completed successfully. The concepts of **form field access, event handling, and live input validation** were implemented. A gym admission form was developed that accepts user details, validates the entered information using JavaScript events, and displays an appropriate success message after successful submission.
